

along — Sprint 5: Full Splitting & Settlement

Sep 28, 2026 · @Praveenkumar Jogannavar

Split out from the along — Sprint Epics, User Stories & Journey Maps document for standalone sprint planning.

Goal: expenses can be split any way a real trip needs, and people can settle up and see it reflected permanently.

User stories

ID	Story	Acceptance
5.1 (US-08)	As a member, I want custom-amount splits	Custom amounts must equal the expense total before save
5.2 (US-09)	As a member, I want percentage splits	Percentages totaling 100% calculate and save each share
5.3 (US-10)	As a member, I want share-based splits	Positive shares calculate proportional amounts, rounding resolved deterministically
5.4 (US-11)	As a member, I want to see my net balance	Balances screen shows my net amount owed or receivable, simplified
5.5 (US-12)	As a member, I want to record a settlement	Confirming payment creates a settlement and updates the balance
5.6 (US-13)	As an owner, I want to record an expense on behalf of a guest	Guest-as-payer expense is valid and included in balances
5.7 (US-14 / US-15)	As a member, I want to edit my own expense but never another's	My edits recalculate balances; editing another member's expense is rejected

Success criteria

- All four split methods pass their full unit-test matrix (equal, custom, percentage, shares) with zero rounding drift.
- $\geq 30\%$ of trips use a non-equal split at least once (adoption signal).
- $\geq 40\%$ of trips with outstanding balances record at least one settlement (settlement completion, PRD success metric).

- Zero settlements exceeding the outstanding debt without the explicit overpayment flag.

User flow

1. Add Expense → Split Configuration → choose custom / percentage / shares → live remaining-amount indicator guides entry → Save.
2. Balances → see simplified debts → tap Settle Up on an outstanding one.
3. Confirm payer, recipient, amount (pre-filled from the debt) → Save → settlement recorded, balance updates.
4. Settlement History → audit past payments.

Journey map

Stage	User does	User feels	System response	Opportunity
Split unevenly	Splits a hotel bill by number of nights each person stayed	Wants control without doing the math themselves	Shares split calculates proportional amounts	Live remaining-amount feedback prevents a frustrating rejected save
Settle up	Pays a friend back in cash after the trip	Wants the app to reflect reality, not just track it	Settlement recorded, balance zeroes out	A one-tap "mark as paid" from the Balances screen reduces friction to record it
Audit	Later wonders "did I actually pay them back?"	Wants certainty, not a guess	Settlement History shows an immutable record	Make the history easy to find from Balances, not buried in Settings
